The Task Force for Global Health is an independent, nongovernmental organization that works to improve health conditions for vulnerable populations around the world, especially people living in poverty. Our eight programs focus on controlling and eliminating debilitating diseases and building durable systems that protect and promote health.

We partner with ministries of health, the World Health Organization, U.S. government agencies, and other organizations to control and eliminate neglected tropical diseases that burden people in 40 developing countries. We are also helping eradicate polio and strengthen global preparedness for influenza pandemics.

In addition to disease control and elimination, we assist countries in building their public health infrastructure. Our work includes training frontline health workers in how to detect and respond to disease outbreaks and building health information systems.

Partnerships Are Essential to Solving Global Health Problems

We use a powerful collaborative model to mobilize resources and expertise, identify synergies, and build the consensus necessary to address large-scale health issues. We currently serve as the secretariat or hub for six major global health coalitions. As a neutral convener, we are able to promote high levels of collaborative action among our coalition partners. Our pharmaceutical partners donate significant quantities of vaccines, antibiotic and antiparasitic medicines valued at billions of dollars annually. As an Emory University affiliate, we also benefit from the close association with a top-tier research institution.

Recipient of the 2016 Conrad N. Hilton Humanitarian Prize

In 2016, we received the prestigious Conrad N. Hilton Humanitarian Prize in recognition of our extraordinary contributions toward alleviating human suffering. This \$2-million award was presented after an extensive evaluation of our record of impact, scientific excellence, innovation, and fiscal stewardship.

Our Future

We have experienced strong and growing demand for our services in recent years, and are exploring opportunities to develop new programs in leprosy, hypertension, and viral hepatitis elimination. Bringing home our global health expertise, we also are planning a new health improvement initiative in DeKalb County, GA, focused on addressing social determinants of health that contribute to poor health outcomes.

Why Are We Called The Task Force for Global Health?

The Task Force was founded as a temporary organization to work on a specific global health problem—low childhood vaccination rates in developing countries. Our founder Bill Foege, who was the architect of smallpox eradication, believed we should continue to work only for as long as our services were needed. But we have endured for more than three decades because of demand for our collaborative and scientific expertise in solving large-scale health problems.
